Hands-on Activity 14.1 Build a Narrative on a Storyboard

I. Activity

1.1 We need to find out how different health indicators have changed across the six ASEAN countries from 2000 to 2020 in order to evaluate regional progress toward the “Good Health and Well-Being” Sustainable Development Goal

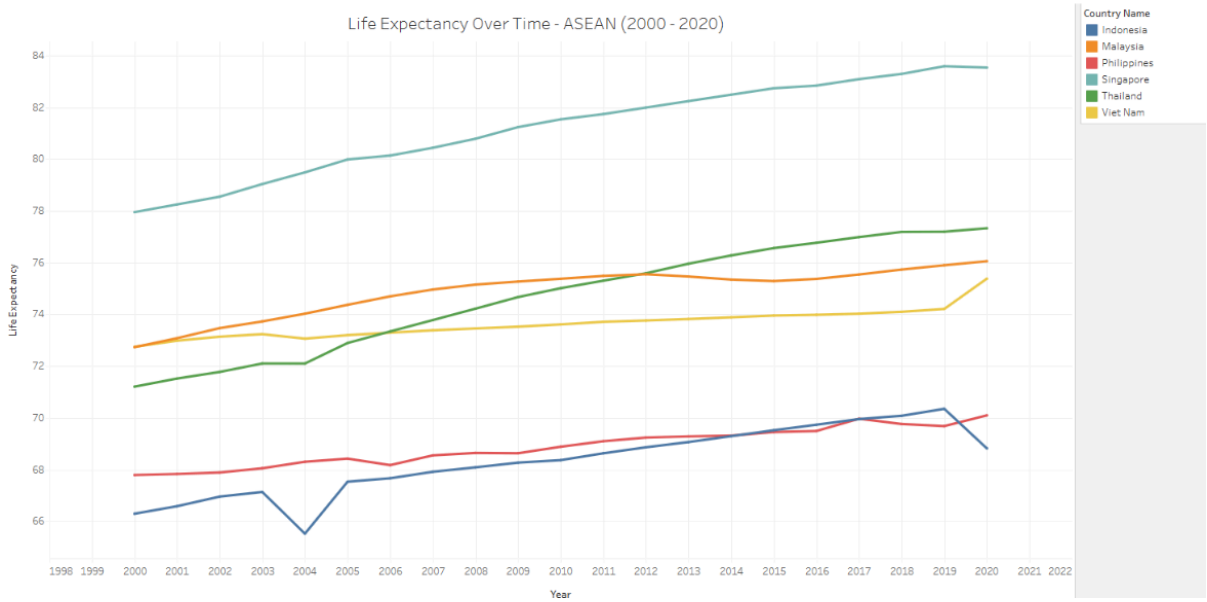
1.2 How does the rates of child mortality directly impact the overall longevity of the population in the ASEAN region?

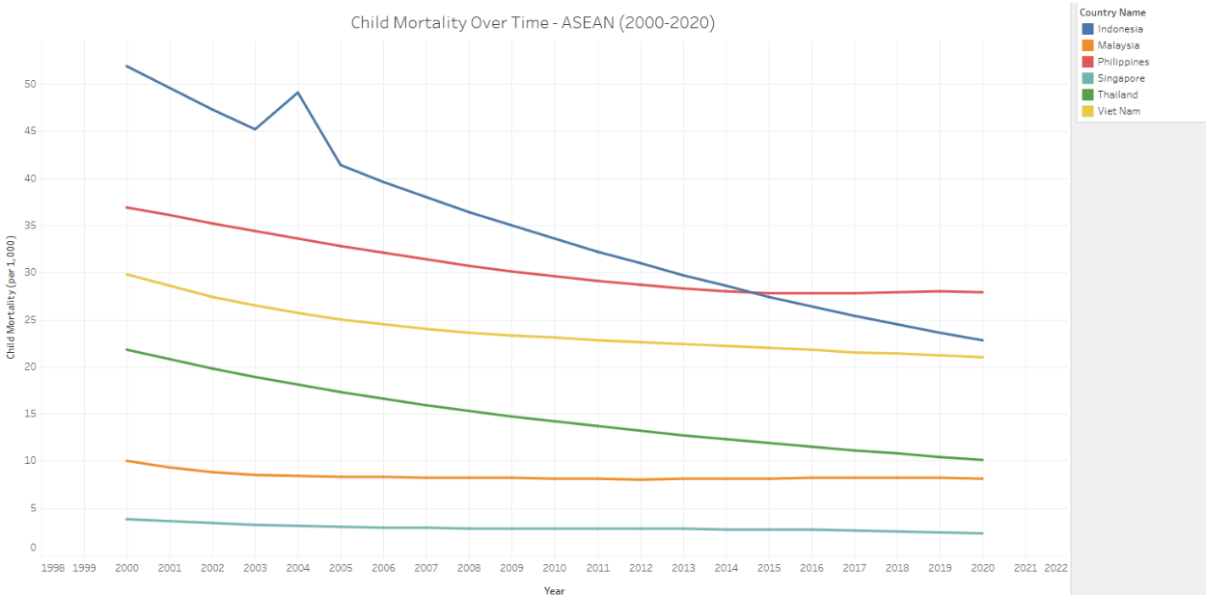
1.3 We used the world bank group to collect the data that we need in order to visualize the different health indicators that we want to see in our storyboard. The site contained different variables which specifically included the countries we are aiming for from Philippines, Thailand, Malaysia, Indonesia, Singapore, and Vietnam.The variables include birth rate, fertility rate, child mortality, life expectancy and more. These data will be used for the SDG we are focused on which is Good Health and Well-Being.

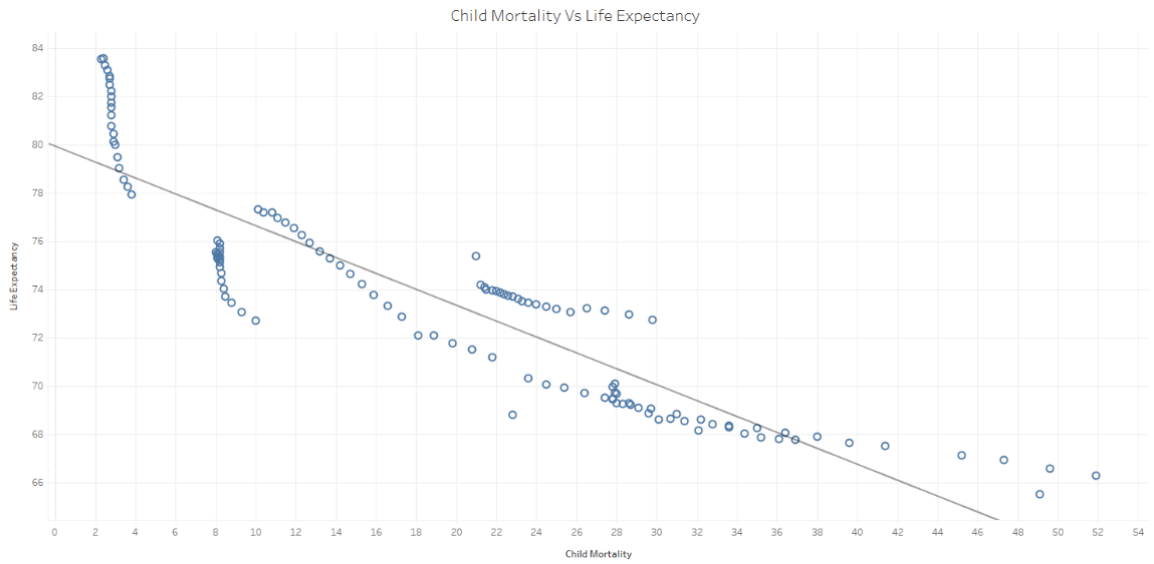
1.4 We used two different visualization methods for our visualization which are the line graph and scatter plot. The line graph was used to show the life expectancy in six different countries over the span of 2000 - 2020, this showed a general upward trend among the six countries and while some had shown dips in their performance it also showed that the life expectancy on the six countries had improved from the starting point of the year 2000. Using the line graph again we showed the child mortality rate of the six countries in which it shows that through the years child mortality has kept on going lower. Finally we used the scatter plot in order to show the correlation between these two health indicators as the scatter plot reveals that they are indirectly proportional to each other.

II. Supplementary Activity

2.1 Visualizations Done







2.2

World Bank Open Data. (n.d.). World Bank Open Data. https://data.worldbank.org/?locations=TH-MY-ID-SG-PH-VN

2.3

We wanted to prove that the health indicators for the six ASEAN countries have changed for the better, having longer life expectancy and lower child mortality rate. This also showed that lowering the child mortality gives a positive effect on life expectancy in a country helping it grow and improve

2.4

We wanted to show that the six ASEAN countries we have decided focus on have been improving, and that while it may experience dips in performance or show a regression at some point of their progress with this visualization we have shown that these countries have come a long way from where they were, that they have improved upon their original status.

III. Conclusion and Analysis

Garcia: The countries that we have chosen have improved and show favourable progress towards the SDG “Good Health and Well-Being” raising the life expectancy for each country and lowering the child mortality.

Losaria: This activity allowed us to review the process of making a storyboard and implement it to a new topic, using new data and visualizations.
The six ASEAN countries showed a universal decline in child mortality per 1000 births and increase in life expectancy, indicating that healthcare of these countries are getting better throughout the years. With Singapore setting the standard with their low child mortality rate and high life expectancy at that start and continually getting better through the years even if it may be small.
